## VANE MOTORS

# LZL Vane motors

## Introduction

LZL vane motors are available in five sizes, offering outputs of 1.05 kW, 1.3 kW, 2.3 kW, 3.4 kW and 5.2 kW, respectively.

They are designed to give outstanding starting and low speed performance. This is achieved by using a six vane motor and by optimum vane/cylinder sealing – obtained through a combination of 'vane air' and interconnecting pins.

Featuring few components, these motors are ruggedly constructed and offer a long service life.

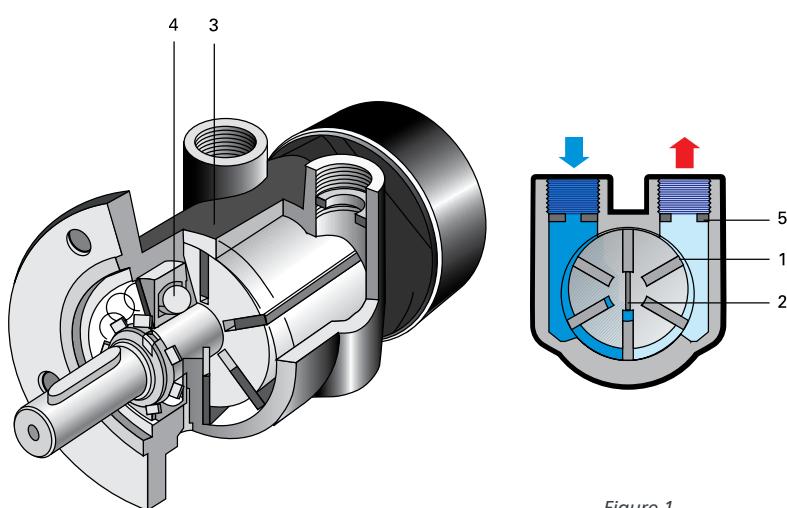

Figure 1

1. Six vanes for high starting torque.
2. Pins to force vanes out and provide starting reliability.
3. Cast iron housing.
4. Long life bearings.
5. Restriction at inlet and outlet ports.

# Installing your air motor

## Air lines

The recommended dimensions of air lines are given in the introductory section to each motor type. Note that exhaust hose is larger than inlet hose.

The recommendations are valid for hose lengths of up to 3 meters. For distances between 3 and 15 meters select a hose diameter one size up, and for distances between 15 and 50 meters select a hose diameter two sizes up.

It is important to note that the output of the motor will be reduced if these guidelines are not followed.

## Recommended hose connectors

Because of the compact dimensions of Atlas Copco vane motors, special hose connectors are available with small key width – facilitating easy installation.

The hose connectors can be ordered through your local Atlas Copco representative.

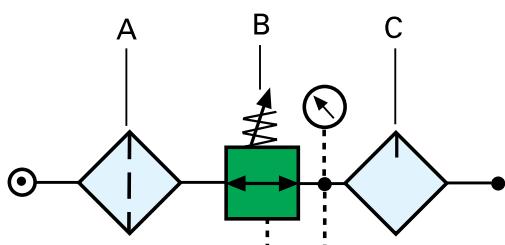

## Air preparation

For optimum performance and maximum machine life we recommend the use of compressed air with a maximum dew point of +10°C. We also recommend the installation of an Atlas Copco refrigeration-type air dryer.

To ensure reliable service an air filter and lubricator should be fitted into the inlet air line – within 3 meters from the motor.

It is recommended that a pressure regulator is also incorporated into the air preparation package. This has the function of maintaining the desired working pressure, and can be used to modify the motor's output to meet the needs of the application.

When selecting an air preparation package, ensure all components have sufficient flow capacity to meet the requirements of the motor. The filter shall remove solid particles larger than 15 microns and also remove more than 90 % of liquid water. A typical arrangement of an air preparation installation is shown below, Figure 9.

A = Filter  
B = Pressure regulator  
C = Oil fog lubricator

Figure 9

## Lubrication free vane motors

Atlas Copco's LZB vane motors and LZB stainless steel run with lubrication free vanes as standard.

The LZB motors with lubricated free vanes can still be lubricated, if the application requires it, but is not dependent on lubricated air, as with traditional vanes.

If running a motor with 100% dry air and no lubrication, performance can be reduced depending on model.

The table below shows how reduced lubrication can affect service life and power for a lubricated vane motor.

| Lubricant quantity<br>mm <sup>3</sup> oil in m <sup>3</sup> | Lubricant free vanes |                | Conventional lubricated vanes |                |
|---|----------------------|----------------|-------------------------------|----------------|
|   | Service life hours   | Output power % | Service life hours            | Output power % |
| 50  | 1000 – 3000          | 100            | 1000 – 3000                   | 100            |
| 10  | 1000 – 2000          | 100            | 500 – 1000                    | 100            |
| 1   | 500 – 1000           | 85 – 95        | 200 – 500                     | 90             |
| 0.1   | 500 – 1000           | 85 – 95        | 100 – 300                     | 80             |
| 0   | 500 – 1000           | 85 – 95        | 10 – 30                       | 30             |

## Shaft loading

The permitted radial and axial shaft extension loadings are illustrated in Figure 2. These values have been calculated for shaft and bearing working lives of at least 1.000 hours at a speed that gives maximum output.

## Restrictors

LZL vane motors are supplied with internal restrictors in the connection ports, to limit the maximum speed.

**Clockwise rotation** – the smaller restrictor (1) is fitted in the inlet port and the larger restrictor (2) in the outlet port (see Figure 3). This is how the motor is delivered.

**Anti-clockwise rotation** – the position of these restrictors must be reversed. Reversing duty – restrictor (1) must be replaced by a second restrictor of type (2). The restrictor (1) must then be fitted into the inlet to the control valve.

For further information, see page 11 chapter "Installation Examples".

It is permissible to remove these restrictors to increase motor output. However, the motor should not be run faster than max allowed speed (see data table).

## Mounting

LZL vane motors may be mounted in any position. To facilitate this, a flange is integrated into the motor casing and a foot mounting is available for some motor variants.

## Connection and hose dimensions

Information on connection size and recommended nipple and hose dimensions for use with LZL vane motors is shown in Table 2. These dimensions are valid for hose lengths up to 3m. For lengths above 3m, choose a hose one size larger.

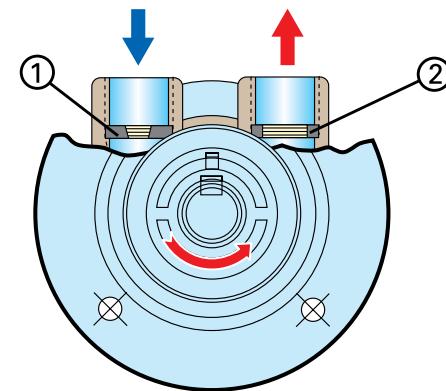

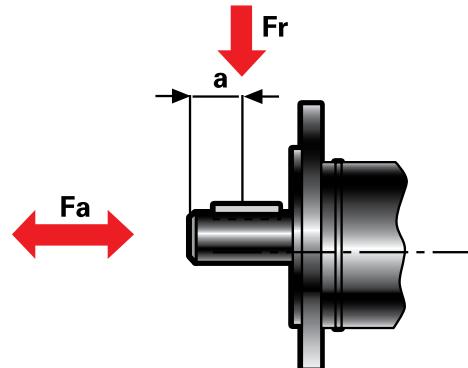

Figure 3

## Hose size up to 3m length

| Motor size | Used as        | Inlet connection thread BSP | Inlet hose* mm | Inlet nipple* dia mm | Outlet connection thread BSP | Outlet hose* mm | Outlet nipple* dia mm |
|------------|----------------|-----------------------------|----------------|----------------------|------------------------------|-----------------|-----------------------|

\* Recommended minimum inner diameter

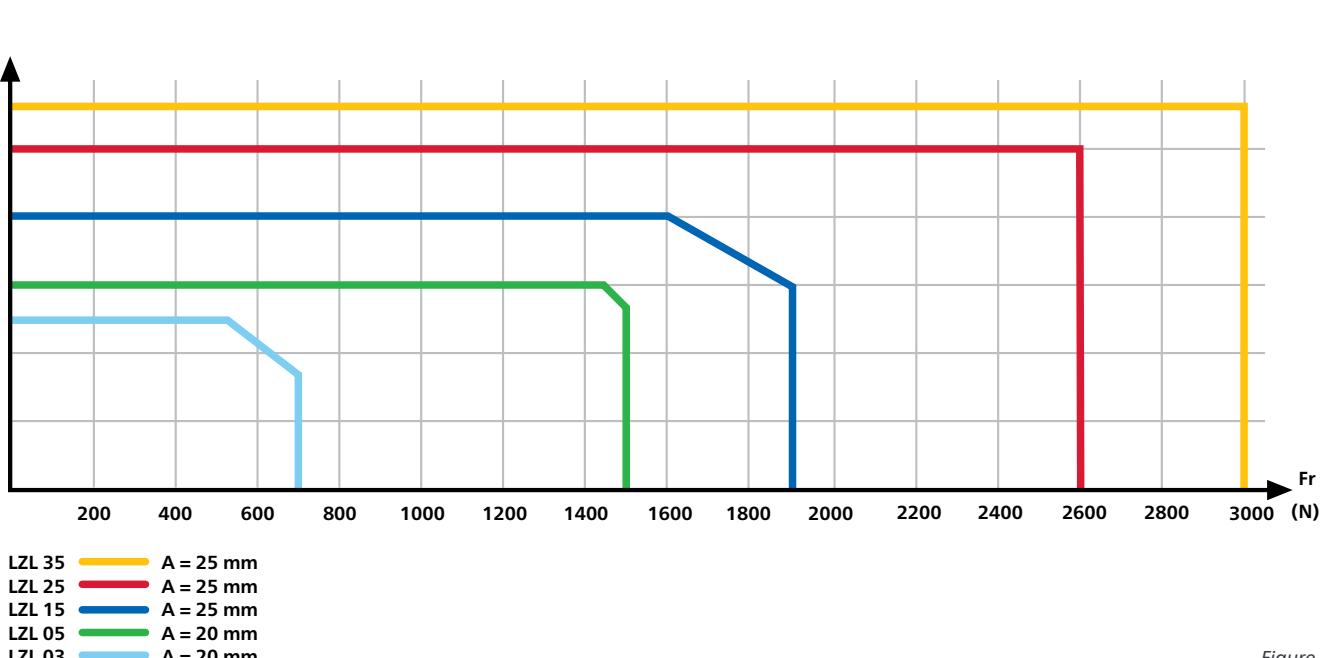

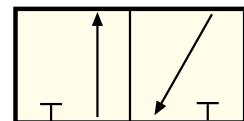

Figure 2

## Directional control valves

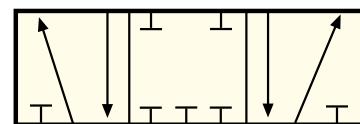

These valves are used to start or stop a motor, or to change its direction of rotation. It is most usual to use what is termed a 5/3 valve to control a reversible motor, and a 3/2 valve to control a Non-reversible motor.

The valve designations refer to the number of connection ports and the number of operating positions the valve provides, for a 5/3 valve this is 5-connection ports and 3 positions.

When selecting any control valve it is important to ensure that it has a sufficient flow capacity to supply the requirements of the motor.

3/2 valve

5/3 valve

Figure 6

F = Air motor

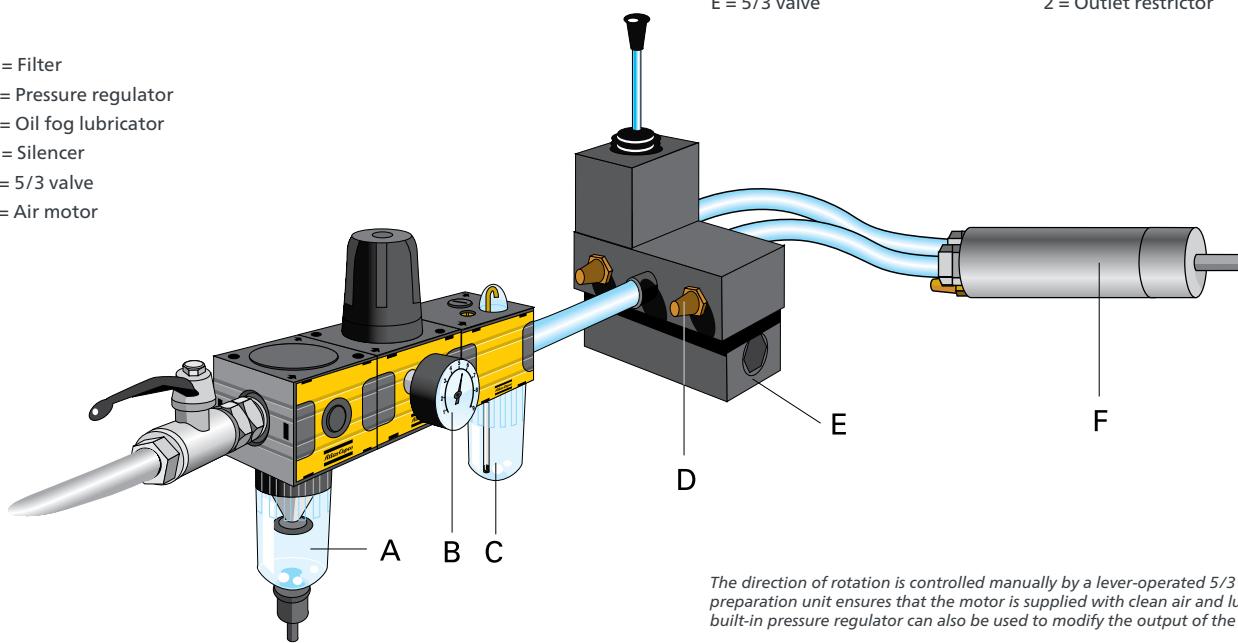

Figure 13

The direction of rotation is controlled manually by a lever-operated 5/3 valve. The air preparation unit ensures that the motor is supplied with clean air and lubrication. The built-in pressure regulator can also be used to modify the output of the motor.

# Methods of modifying Lzb – Lzl motor output

## Throttling

A throttle is usually fitted into the motor's inlet, although it can also be complemented with some throttling at the exhaust. You should never create a back pressure above 1 bar at the exhaust.

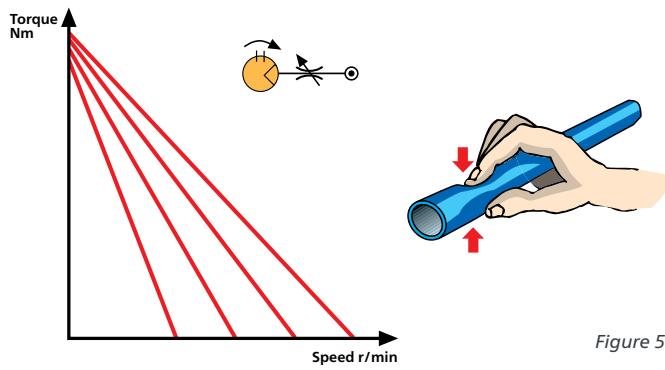

Figure 5

## Pressure regulation

When using a pressure regulator it is mostly fitted into the motor's inlet hose. The use of pressure regulation is ideal when control of the stall torque is required and a high starting torque is not so important, Figure 6.

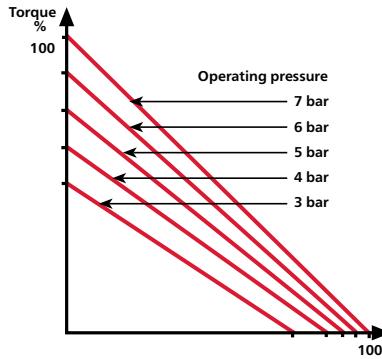

Figure 6

## Pressure regulation

Sometimes the motor operates at other supply pressures than 6.3 bar. In these cases the performance of a motor must be re-calculated to ensure the working point can be achieved.

To calculate performance at supply pressures other than 6.3 bar, multiply the data at 6.3 bar by the correction factors shown in table below.

| Correction factors |     |        |       |                 |
|--------------------|-----|--------|-------|-----------------|
| Air pressure       |     | Output | Speed | Torque          |
| bar                | psi |        |       | Air consumption |
| 7                  | 101 | 1.13   | 1.01  | 1.09            |
| 6                  | 87  | 0.94   | 0.99  | 0.95            |
| 5                  | 73  | 0.71   | 0.93  | 0.79            |
| 4                  | 58  | 0.51   | 0.85  | 0.63            |
| 3                  | 44  | 0.33   | 0.73  | 0.48            |

It is also easy to calculate the inlet pressure required to achieve a desired working point.

### Example:

An Lzb22-L-A036-11 is required to run at 1155 r/min and produce 1.2 Nm; calculate the required inlet pressure to achieve this. For this motor at maximum output the torque is 1.5 Nm and the speed is 1650 r/min.

$M_1$  = desired torque

$n_1$  = desired speed

$M_2$  = torque at maximum output

$n_2$  = speed at maximum output

Calculate the ratios  $M_1/M_2$  and  $n_1/n_2$ . Therefore  $M_1/M_2 = 0.8$  and  $n_1/n_2 = 0.7$

Apply these values to the diagram in Figure 8 and read off the pressure at the intersection point.

The required inlet pressure is 4.2 bar (61 psi)

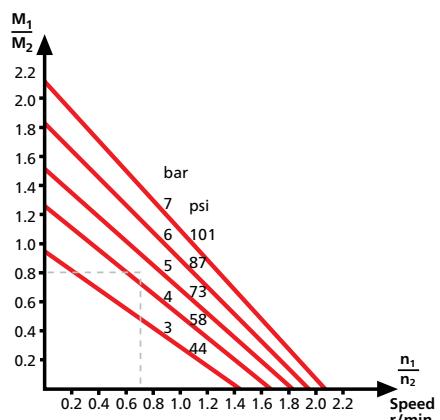

Figure 8

# LZL vane motors

1.05 – 6.5 kW

1.4 – 8.7 hp

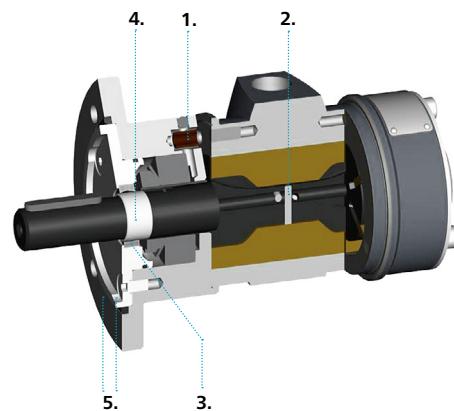

## Power motors (P)

The power motors come in all five sizes and are designed to give highest power and still maintain good low speed characteristics. These motors are delivered with lube free vanes and can theretofore operate without lubrication.

Typically these motors are characterized by:

- Reliable starting
- High starting torque and good low speed characteristics
- Wide speed and torque range
- Sturdy, compact construction to withstand rough treatment
- Inlet and outlet port restrictors permit free speed running.
- Long working life and easy servicing

EX certification valid for fixture mounted use only with a maximum surrounding temperature of +40°C (104°F).

1. Rubber hose valves for venting bearing and seals.
2. Vane pins.
3. Double seals.
4. Stainless steel bushing.
5. Aluminum front with stainless steel screws.

\* Motors without restrictor plates in the air in- and outlet, the motor should not be run above max allowed speed.

\*\* Max allowed speed for the specified ATEX code is 5000 rpm.

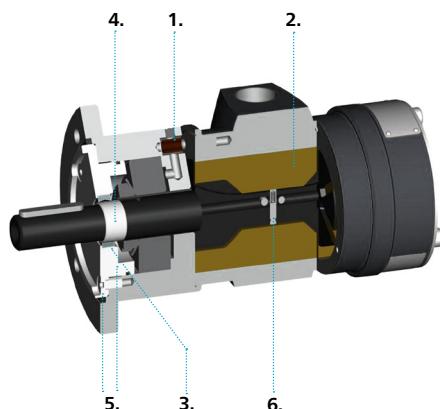

## Low to medium speed motors (M)

These motors are, among other applications, ideal for mixing.

To further ensure a clean and hygienic environment, a double shaft seal is used and all components that come in contact with the mixed medium are made of corrosion-resistant material. Thanks to the cylinder design and highly stable bearings, LZL motors require no extra drive shaft support and are ready for mounting without add-ons. For good adaptability, the motors are available with AC, IEC or NEMA.

EX certification valid for fixture mounted use only with a maximum surrounding temperature of +40°C (104°F).

1. Rubber hose valves for venting bearing and seals.
2. Lube free vanes.
3. Double seals.
4. Stainless steel bushing.
5. Aluminum front with stainless steel screws.
6. Spring loaded pins.

\* Motor without restrictor plates in the air in- and outlet, the motors should not be run above max allowed speed.

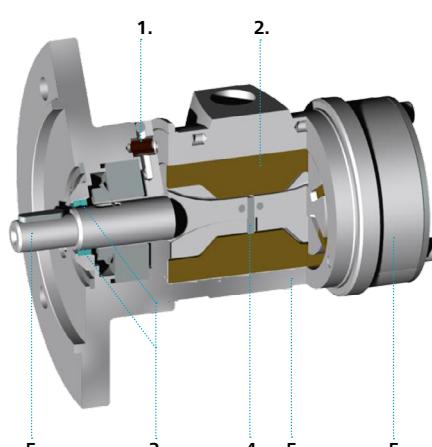

## Stainless steel motors

Stainless steel motors are available in the size LZL05. They are lube free and have the same features as the other lube free motors. All external parts, including the output shaft, are made of stainless steel, which makes the motors very corrosion resistant and ideal for applications such as the food industry, corrosive mixing and the chemical industry.

The material used in all external parts is ISO 683/XIII Type 17, SS 14 2346, DIN 17440 X 12CrNiS188.

The material in the output shaft is ISO 683/XIII Type 9b, SS 14 2321, DIN 17440 X 22CrNi17.

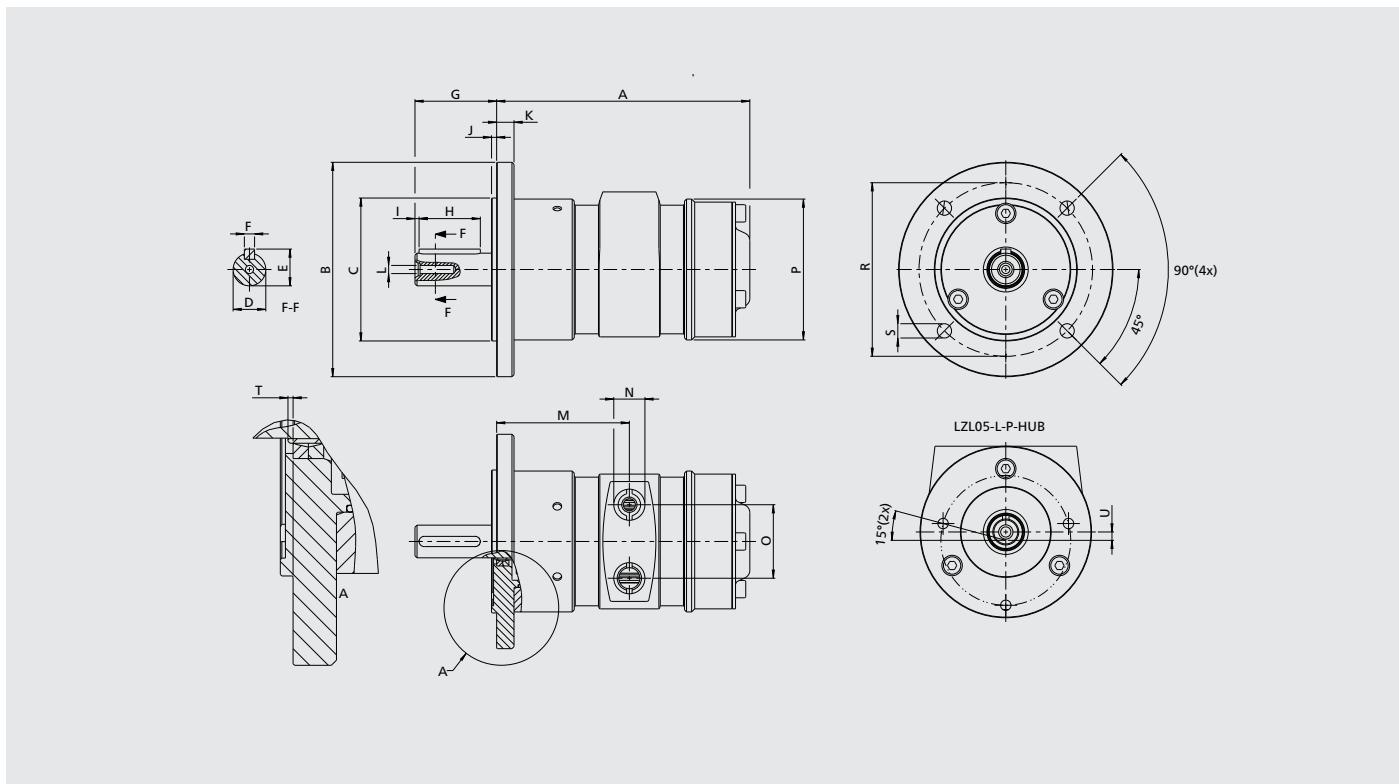

EX certification valid for fixture mounted use only with a maximum surrounding temperature of +40°C (104°F).

1. Rubber hose valves for venting bearing and seals.
2. Lube free vanes.
3. Double seals.
4. Vane pins.
5. Stainless steel.

## LZL: Performance curves at air pressure 6.3 bar (91 psi)

### Power motors

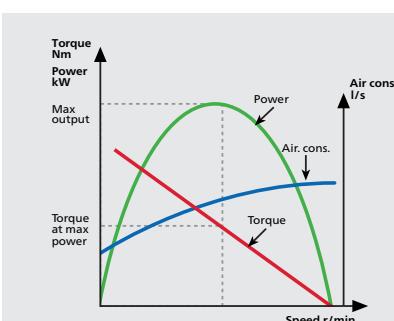

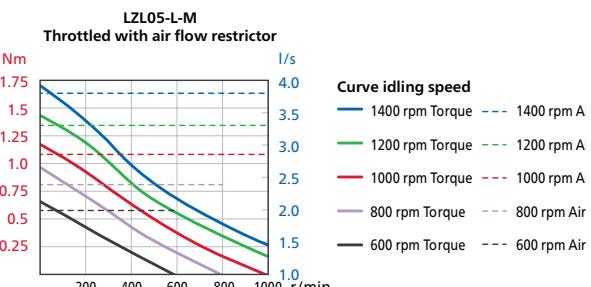

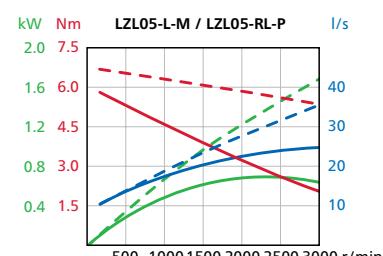

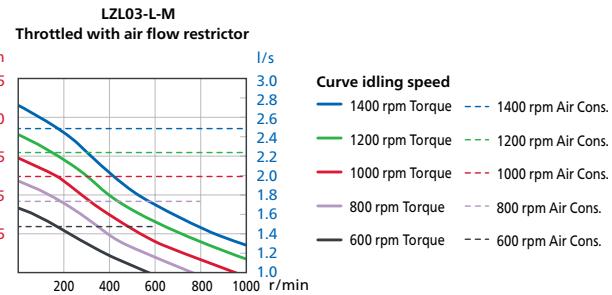

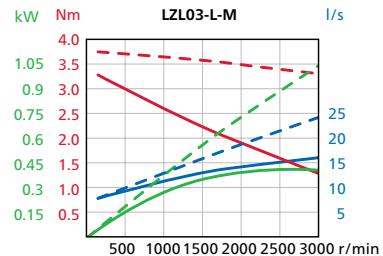

The solid lines represent restricted motors and the dotted lines unrestricted motors.

The restricted motors are guaranteed not to exceed the ATEX speed limit when running at 6.3 bar or below.

## LZL: Performance curves at air pressure 6.3 bar (91 psi)

### Low to medium speed

For information about performance curves, see page 6.

# LZL vane motor gear unit combinations

Combined with helical gear units, LZL vane motors can be used over a very wide torque and speed range. Gears have a ratio range between 6.3:1 to 164.5:1, corresponding to a speed range of 512 to 17 r/min and output torque up to 1836 Nm at max. output.

## Helical gear units, type BF

Helical gear units are available in 2, 3, or 4-stage configurations. They deliver high efficiency levels and are available in a wide choice of ratios, Figure 4.

Figure 4

## Shaft loading

The maximum allowable radial load on the output shaft of each gear unit, at the halfway point on the shaft can be obtained from the data tables for each model.

The maximum permitted axial load is 20% of the table value for radial load if full permitted radial load is occurring. If there is no radial load the maximum permissible axial load is 50% of the table value for radial force.

## Calculating sprocket or gearwheel dimensions

If it is intended to fit a sprocket, gearwheel or pulley onto the output shaft, the radial load generated when running must be within the permitted level.

The following formula is used to calculate the minimum diameter of these components, to ensure the radial load does not exceed this limit.

$$D_{\min} = \frac{2 \times M \times k_t}{F} \text{ [m]}$$

where   
 M = load torque in Nm  
 F = permitted radial force halfway along the shaft extension  
 k<sub>t</sub> = 1.0 for sprocket  
 1.3 for gear wheel  
 1.5 for pulley

## Operating speed

To avoid damage to seals the gear units should not be run continuously above 4200 rpm.

## Mounting

There are two options of mounting arrangement: Foot or Flange as illustrated in Figure 5.

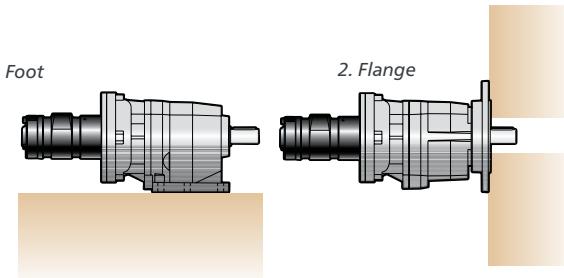

Figure 5

## Temperature

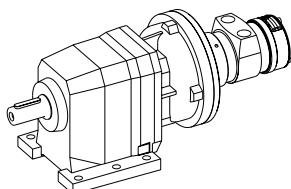

The gear units can operate within an ambient temperature range of -20°C (-4°F) and +40°C (104°F).

If it is required to use a gear unit outside these temperature limits please consult your local Atlas Copco representative.

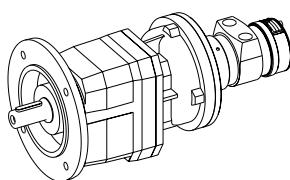

## Mounting position

Allowed mounting positions are shown below. Installing the motor underneath the gear unit is not allowed.

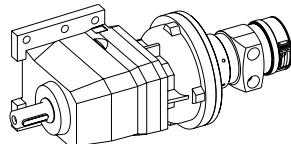

The alphanumeric numbers B3, B5, etc., are referred to in the product information enclosed at delivery.

Air motor LZL25 with helical gear units type BF:  
Performance curves at air pressure 6.3 bar (91 psi)

For information about performance curves, see page 6.

# Air motors L<sub>Z</sub>L35

with helical gear units

5.1 – 6.3 kW

6.8 – 8.4 hp

The LZL motor connects to the helical gear through an IEC interface

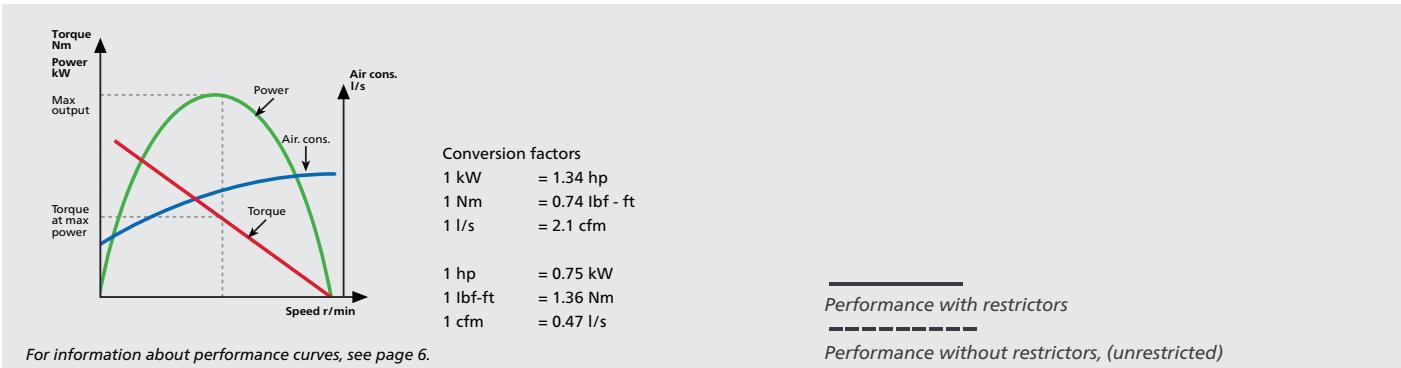

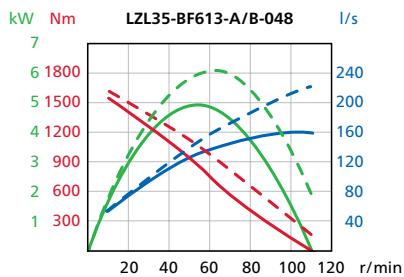

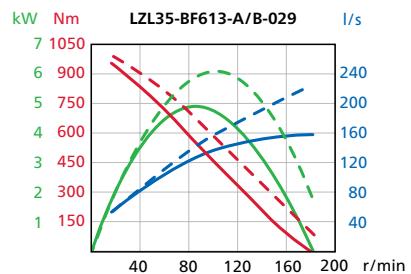

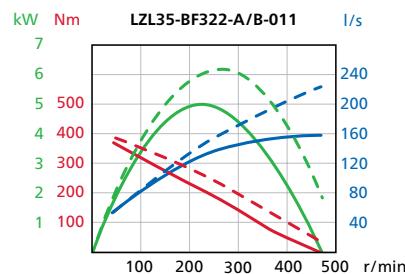

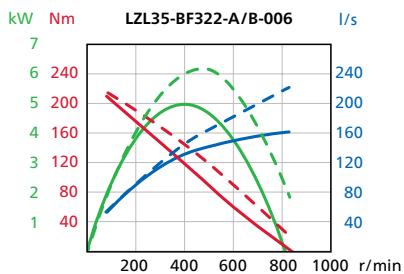

### Data at air pressure 6.3 bar (91 psi)

| Model                | Ratio | Max output |     | Speed at max output | Torque max output |       | Min starting torque |       | Free speed | Max allowed speed | Air cons. at max output |     | Weight |     | Max radial load at max output | Ordering No. |

# Explosion preventive guidelines

In addition to the product instructions for air motors, the following guidelines apply to explosion protected air motors

## Temperatures

- The maximum surrounding temperature for which the certification is valid is 40°C (104°F)
- 40°C (104°F) is also the maximum allowed temperature of the compressed air when it enters the motor
- If the motor is installed in a equipment, the entire equipment has to correspond to the guidelines 2014/35/EU
- Make sure that the compressed air fulfill our quality demands (quality classes 2.4.3. and 3.4.4 respectively 3.5.4 acc. to ISO/DIS 8573-1)
- Do not exceed maximum pressure of 6.3 bar, or as stated on the motor nameplate. Exceeding the operating pressure can increase the surface temperature due to higher rotating speed and the motor can become an ignition source
